Subject: ChatGPT Sites hosting measurements needed for Retirement Forecast MCP

Hello OpenAI Support,

Please route this request to the ChatGPT Sites hosting team.

I own Retirement Forecast, <https://retirementforecast.us>.

Site ID: appgprj_6ab98ae02cd481919b2a1d47edb8ee3c

Live saved version: 118

Source commit: d5d1c0f2868b3a3059239e9504688596f200feca

Latest successful deployment: appgdep_6ac3a792740c81918b4d20c19dddfa56

MCP endpoint: <https://retirement-readiness-lab-web.rtsoliday123.chatgpt.site/mcp>

We are finishing acceptance testing for two synthetic retirement comparisons. All 740 local tests pass. Hosted repeated calculations, overlap rejection, explicit cancellation, and recovery after disconnect or an abandoned lease have passed. Actual provider CPU-termination recovery has not been verified.

The Sites tools expose request CPU and wall time, but do not expose the effective CPU configuration or peak isolate memory. Could you provide the following evidence, or a supported way for us to obtain it?

1. Confirm whether the deployed Worker has at least 30,000 ms of CPU allowance. Its packaged wrangler configuration requests `limits.cpu_ms`: 30000.
2. Measure peak isolate memory for three repeated runs of each approved synthetic 1,000-path comparison (employer Roth and separate couple). Our project's acceptance threshold is below 90 MiB, or 94,371,840 bytes. Please identify the measurement method and Worker version, with CPU and wall times per run.
3. Help arrange a controlled provider CPU-termination test, followed by successful calculation after our two-minute lease expires, without restarting or redeploying between those requests. A simulated abandoned lease has passed, but does not prove recovery after actual CPU termination. Please agree the controlled test arrangement with me before changing production settings.

The attached retirement-forecast-support.pdf contains the reviewed synthetic requests and sanitized verification evidence from October 5, 2026 (timestamps are UTC). A ZIP with machine-readable JSON is also available if needed. The evidence contains no authentication headers, cookies, access tokens, or personal retirement plans.

These are our project release criteria, not a claim about published Sites guarantees. General MCP calculations remain disabled while we obtain the missing evidence. Owner verification controls and the temporary shortened deadline are currently disabled too (runtime revision 14).

Thank you.

Verification status

Saved Site version 118; source d5d1c0f2868b3a3059239e9504688596f200feca. Local suite: 740 passed, 0 failed, exit 0. Focused suite: 42 passed, 0 failed. Build: exit 0.

The nine historical snapshot failures were replaced with comparisons against frozen original engine sources. The current engine matches complete outputs and monthly traces for the retained fixtures. This is part of the completed 740-test suite.

Native connected MCP test	Wall time (ms)	CPU time (ms)	Complete output parity
Employer Roth, paired 1,000 paths	7625	6895	Passed
Separate couple, paired 1,000 paths	18821	17729	Passed

Owner browser checks

Check	Result	Observed recovery / round trip
overlap	Passed	1982 ms
MCP cancellation	Passed	416 ms
HTTP disconnect	Passed	819 ms
abandoned lease	Passed	743 ms
employer-roth, run 1	Passed	13396 ms
employer-roth, run 2	Passed	11958 ms
employer-roth, run 3	Passed	12576 ms
separate-couple, run 1	Passed	9004 ms
separate-couple, run 2	Passed	9902 ms
separate-couple, run 3	Passed	8991 ms

Explicit MCP cancellation recovered in 416 ms. For HTTP disconnect, the provider canceled execution before application cleanup; recovery used the two-minute lease expiry. The simulated abandoned lease test also recovered after expiry, and did not force a provider CPU termination.

Repeated browser requests retained complete summary parity. These timings demonstrate the measured requests; they do not establish a universal latency guarantee. Browser round-trip time and provider Worker wall time use different measurement boundaries.

Current runtime revision 14: general MCP calculations disabled, owner verification controls disabled, shortened deadline absent. Effective CPU allowance, hosted peak isolate memory and actual CPU-termination recovery remain unverified.

Provider request evidence

Sanitized provider events contain only timestamps, request IDs, Worker version IDs, paths, status, outcome, CPU time and wall time. No authorization headers, cookies or request bodies are included. All timestamps are UTC.
